TouchGift Website Review

Comprehensive HCI, Visual Design, Accessibility, Usability, and Content Quality Report

Website: `https://touch-gift-shop.vercel.app/`
Brand: TouchGift / Touch Gift Shop
Market: Nairobi and Kenya
Assessment date: October 20, 2026
Prepared from: Website inspection, browser observations, responsive viewport testing, DOM review, interaction testing, console inspection, content analysis, and accessibility-oriented evaluation.

1. Executive Summary

TouchGift is a Kenyan online gifting and delivery platform offering gift sets, hampers, wines, spirits, fragrances, corporate merchandise, awards, drinkware, flowers, gift cards, anonymous gifting, photo-proof delivery, gift pooling, subscriptions, rewards, and same-day Nairobi delivery.

The website has a distinctive premium identity. Its dark plum background, magenta accents, gold highlights, editorial serif typography, product photography, and Kenyan delivery positioning create a recognizable boutique-gifting experience. Several features are genuinely useful and locally relevant, including anonymous delivery, M-PESA-oriented group gifting, corporate bulk ordering, delivery photo proof, and same-day delivery within Nairobi.

However, the site currently suffers from significant quality and usability problems. The main issue is not that the design lacks ambition. Rather, it attempts to communicate too many ideas at once. The homepage combines product browsing, emotional mood selection, corporate services, promotional cards, AI tools, gift subscriptions, loyalty rewards, social proof, multiple product carousels, FAQs, newsletters, floating assistants, and several navigation systems.

This creates an experience that can feel visually impressive at first but increasingly crowded, repetitive, and difficult to scan. The website has the appearance of a premium storefront, but parts of the content and component structure feel insufficiently edited.

The review identifies the following major themes:

- Strong brand distinction but inconsistent execution.
- Medium-to-high risk of “AI slop” characteristics.

- Too much generic luxury and SaaS-style marketing language.
- Conflicting product and category counts.
- Repeated testimonials and duplicated product content.
- A visible dummy WhatsApp number in the desktop header.
- Social-proof counters that initially display alarming zero values.
- Serious light-mode contrast failures.
- Auto-changing visual content without an obvious pause control.
- Mobile controls that occupy too much screen space and cover content.
- Incomplete or misleading navigation affordances.
- Weak semantic structure for headings and interactive controls.
- A homepage that is too long and promotion-heavy for a first-time shopper.

The site's current production readiness is therefore limited from an HCI perspective. The most urgent fixes should address trust, accessibility, mobile layout, contrast, navigation correctness, and factual consistency before significant advertising or traffic acquisition.

2. Scope and Methodology

2.1 Assessment scope

The review considered:

- Homepage structure and content.
- Desktop, laptop, tablet, and mobile layouts.
- Navigation and search.
- Product discovery.
- Product cards and product detail pages.
- Cart and add-to-bag interaction.
- Mood selector.
- Gift Assistant and AI Gift Finder.
- Corporate gifting section.
- Gift Lab and gifting features.
- Testimonials and social proof.
- Footer, contact information, and FAQ.
- Theme switching.
- Floating widgets and mobile navigation.
- Visible accessibility characteristics.
- Console and browser warnings.

- Possible AI-generated or overly templated design patterns.

2.2 Tested viewport categories

The website was reviewed across the following viewport types:

Device category	Approximate viewport	Main observations
Desktop	1440 × 900	Full navigation, multi-column layouts, fixed header, announcement collisions
Laptop	1280 × 800	Tighter navigation and hero spacing
Tablet portrait	768 × 1024	Hybrid layout, wrapped navigation, floating-control overlap
Mobile	390 × 844	Bottom app navigation, single-column layout, floating-widget congestion
Compact mobile	375 × 667	Severe lower-screen crowding and overlapping controls
Narrow reflow	320px width	Off-screen controls and oversized carousel tracks
Zoom-equivalent layout	Approximately 720px effective width	Desktop interface changes to a mobile-style layout

2.3 Evidence classifications

All findings should be interpreted using the following evidence categories.

Directly observed fact

A result visibly confirmed through browser inspection, DOM inspection, computed CSS, console messages, viewport resizing, or interaction testing.

Design interpretation

A professional assessment based on HCI, visual design, information architecture, cognitive load, typography, and content-quality principles.

Requires code, analytics, or user testing

A hypothesis that requires source-code review, quantitative analytics, moderated usability testing, assistive-technology testing, or real customer research before it can be considered confirmed.

2.4 Evaluation standards

The assessment was informed by:

- WCAG 2.2 accessibility principles.
- Nielsen Norman Group usability heuristics.
- Responsive design and mobile usability principles.

- Visual hierarchy and information-scent principles.
- Content authenticity and trust principles.
- Anti-AI-slop design considerations.

WCAG 2.2 addresses minimum text contrast, focus appearance, target size, focus visibility, moving content, and keyboard usability. Normal text generally requires a contrast ratio of at least 4.5:1, while WCAG 2.2 also defines requirements for focus appearance and a minimum 24 × 24 CSS-pixel target size in applicable situations. [1] [2] [3] [4]

Nielsen Norman Group describes heuristic evaluation as a review against broad rules of thumb for interaction design, rather than a substitute for user testing. [5] [6]

3. Website Identification

3.1 General details

Attribute	Observed information
Website name	TouchGift / Touch Gift Shop
Public URL	`https://touch-gift-shop.vercel.app/`
Hosting indication	Vercel deployment
Frontend indication	Next.js / React-style implementation with Tailwind-like utility classes
Backend indication	Supabase data and storage services
Payment references	PesaPal, M-PESA, Visa, Mastercard
Main market	Nairobi and Kenya
Main operating promise	Same-day delivery in Nairobi and next-day delivery nationwide
Brand slogan	“Just Say It” / “Just say it. We’ll make it happen.”
Contact location	Park Towers, Utalii Street, Nairobi
Main product types	Gifts, hampers, drinks, fragrances, corporate merchandise, awards, stationery, accessories, flowers, and gift cards

3.2 Primary business proposition

The website positions TouchGift as more than a standard online shop. It presents itself as a gifting concierge that helps customers:

- Choose a gift.
- Find products by mood, category, budget, or occasion.
- Build a hamper.
- Send gifts anonymously.
- Arrange gift delivery.

- Add corporate branding.
- Pool contributions through M-PESA.
- Receive delivery photo proof.
- Schedule future gifts.
- Use gift cards.
- Earn rewards.
- Get AI-powered recommendations.

This breadth creates commercial potential but also creates a major communication challenge: the homepage has to explain too many capabilities before the visitor completes a simple buying task.

4. Overall Findings

4.1 Main strengths

TouchGift has several genuine strengths:

1. It has a strong and recognizable visual direction.
2. It uses locally relevant pricing and delivery language.
3. It promotes useful Kenyan payment and gifting behaviors.
4. It offers a broad product catalog.
5. It supports both individual and corporate customers.
6. Its product detail pages provide clear purchase actions.
7. Search and product discovery are generally present.
8. Product customization is more thoughtful than a basic e-commerce flow.
9. The brand’s dark premium style can differentiate it from generic storefronts.
10. Same-day Nairobi delivery is communicated clearly.

4.2 Main weaknesses

The most important weaknesses are:

1. Too much content on the homepage.
2. Repeated sections and duplicated content.
3. Conflicting catalog numbers.
4. Generic luxury copy.
5. Multiple competing CTAs.
6. Mobile interface congestion.
7. Light-mode contrast problems.

8. Weak focus and keyboard affordances.
9. Unclear semantic structure.
10. A visible dummy WhatsApp destination.
11. Social-proof counters exposing bad initial values.
12. Animated content that changes without clear user control.
13. Aesthetically inconsistent emojis and decorative elements.
14. Promotional content competing with product browsing.
15. Navigation controls that may imply functionality they do not provide.

5. Website Structure and Content Inventory

5.1 Header and announcement area

The desktop header contains:

- Announcement ticker.
- Brand logo.
- Search field.
- Corporate link.
- WhatsApp link.
- Cart icon.
- Reminders.
- Theme toggle.
- Sign-in link.
- Get-started button.
- Secondary navigation.
- Mega menus.

The homepage also displays multiple promotional announcements, including:

- Ruracio Season messaging.
- Corporate bulk-order messaging.
- Anonymous-gifting messaging.

Observations

The announcement area appears to contain multiple messages competing for the same visual space. The Ruracio Season message and corporate message were reported as overlapping on initial desktop rendering.

This is a high-priority issue because the announcement bar occupies one of the first places users look. If multiple messages render on top of one another, the site immediately appears broken or unpolished.

Recommended direction

Use one announcement bar at a time. If rotating messages are necessary:

- Display only one message at a time.
- Use a stable height.
- Add a pause or dismiss control.
- Ensure the rotation does not cause layout shifts.
- Make each message readable on mobile.
- Avoid combining urgency, corporate promotion, and anonymous gifting in the same visual strip.

5.2 Hero section

The hero uses:

- Dark luxury photography.
- Serif display headings.
- Gold eyebrow labels.
- Magenta or gold CTA buttons.
- Trust badges.
- Same-day delivery messaging.
- Anonymous gifting messaging.
- Rotating mood or hero content.

Reported hero language includes:

- “Elevate the art of gifting.”
- “Say more without saying more.”
- “A memory in a bottle.”
- “Breathtaking floral arrangements designed to feel intimate, intentional and completely unforgettable.”

Strengths

The hero establishes an emotional, premium tone. It communicates gifting as an experience rather than as a simple retail transaction.

Weaknesses

The language is often abstract. It does not always answer the practical questions a shopper has:

- What can I buy?
- How much does it cost?
- Where can it be delivered?
- How quickly can it arrive?
- Can I order flowers, alcohol, perfume, or a hamper?
- Can I add a note?
- Can I pay with M-PESA?

The hero also appears to change content automatically. That creates a risk that a user will begin reading one message while the interface changes to another.

Recommended direction

Make the primary hero message clear and stable. For example:

> Same-day gifts delivered across Nairobi.

Then support it with concrete information:

> Hampers, flowers, perfumes, drinks, and corporate gifts. Order by 6 PM for same-day Nairobi delivery.

Use the emotional language lower on the page, where it can enrich the brand rather than carry the entire value proposition.

6. Navigation and Information Architecture

6.1 Desktop navigation

The desktop navigation includes:

- Find a Gift.
- Gift Lab.
- Occasions.
- Collections.
- Corporate.
- Gift Cards.
- Search.
- Cart.
- Reminders.

- Account.
- Theme switch.

The “Find a Gift” menu reportedly opens a multi-column mega menu covering:

- Gift sets and hampers.
- Fragrances.
- Flowers.
- Wine and spirits.
- Corporate merchandise.
- Budget ranges.
- Gift matching.

Strengths

The navigation recognizes that shoppers may search by:

- Category.
- Budget.
- Occasion.
- Corporate use case.
- Gift type.
- Personalization need.

This is appropriate for a broad catalog.

Weaknesses

The navigation may offer too many top-level choices. A user looking for a simple birthday gift may see several possible paths:

- Mood selector.
- Find a Gift.
- Occasions.
- Collections.
- Gift Lab.
- AI Gift Finder.
- Category bar.
- Search.
- Under-KSh-2,000 chip.
- Gift Assistant.

Too many equally prominent paths increase decision-making effort.

A reported issue also indicates that the “Occasions” navigation control appears to have a dropdown affordance but does not open a menu during testing. If a control looks interactive but does not respond, it violates basic user expectations.

Recommended direction

Reduce top-level navigation to the most important shopper paths:

- Shop.
- By Occasion.
- By Category.
- By Budget.
- Corporate.
- Gift Lab.

Make sure every element with a chevron either opens a working menu or links clearly to a destination. A decorative chevron should not imply an unavailable interaction.

6.2 Mobile navigation

The mobile experience reportedly uses:

- A compact mobile layout.
- Horizontal filter chips.
- A fixed bottom navigation bar.
- Floating WhatsApp control.
- Floating Gift Assistant control.
- Theme toggle.

The bottom navigation contains:

- Home.
- Gift Lab.
- Orders.
- Reminders.
- Account.
- Theme.

Strengths

A bottom navigation bar can make core destinations accessible on mobile. Persistent access to orders and account functions can be useful.

Weaknesses

The mobile interface reportedly lacks a sufficiently clear top-level brand and search experience at some breakpoints. The fixed bottom bar and floating buttons also occupy a large portion of the lower screen.

On the 375 × 667 viewport, the lower area may contain:

- Bottom navigation.
- WhatsApp button.
- Gift Assistant button.
- Product or mood-selector content.
- Sticky purchase controls.

This creates a high risk of obstruction and accidental taps.

Recommended direction

Use one mobile action system rather than several overlapping systems:

- Keep a compact top header with logo and search.
- Keep the bottom navigation limited to four or five destinations.
- Move the theme toggle to the account or settings area.
- Put WhatsApp inside the menu or provide one carefully positioned floating button.
- Ensure all page content has bottom padding equal to the full fixed-interface height.
- Reposition or hide the Gift Assistant when another modal or sticky CTA is active.

7. Product Discovery and Catalog

7.1 Product categories

The website presents categories including:

- Wines.
- Gin.
- Rum.
- Champagne and sparkling.
- Brandy and cognac.
- Liqueurs.
- Ciders.
- Spirits.
- Non-alcoholic products.

- Drinkware.
- Awards and trophies.
- Stationery and office products.
- Accessories.
- Bags.
- Clocks and timepieces.
- Tech and gadgets.

Other sections also mention:

- Flowers.
- Fragrances.
- Gift sets.
- Hampers.
- Corporate merchandise.

7.2 Catalog-count inconsistencies

The site reportedly presents several different totals:

- “711 more gifts across 16 categories.”
- “Browse All 200+ Gifts.”
- “Across 30+ curated categories.”
- A catalog or shop header showing approximately 1,688 gifts.
- “500+ curated products.”
- “255 authentic fragrances.”

These numbers may refer to different subsets, but the interface does not explain the difference.

Trust impact

A visitor may reasonably ask:

- Are there 200 products or 1,688?
- Are there 16 categories or 30+?
- Does “711 more gifts” refer to a specific section or the entire catalog?
- Are all products in stock?
- Are all products eligible for same-day delivery?

Recommended direction

Use dynamically bound values from a single source of truth. If different sections refer to different subsets, label them clearly:

- “1,688 products in the full catalog.”
- “711 products currently shown across featured categories.”
- “255 fragrance products.”
- “16 drink and corporate categories.”

Do not use approximate marketing figures in one section and precise database figures in another unless the distinction is visible.

7.3 Product-card design

Product cards reportedly include:

- Product image.
- Title.
- Volume or specifications.
- Price.
- Category.
- Badge.
- CTA or click target.

Cards use:

- Rounded corners.
- Dark surfaces.
- Hairline borders.
- Ambient shadows.
- Pink, gold, amber, and green badges.

Strengths

The product cards appear visually consistent. Product information such as bottle size, alcohol percentage, and price can be useful for decision-making.

Weaknesses

The product cards may visually resemble promotional service cards. This creates uncertainty about which cards are products and which are informational features.

There is also a reported clipping problem in which a product title appears partially hidden within a trending card.

Recommended direction

Clearly distinguish:

- Products.
- Services.
- Promotional banners.
- Tools.
- Editorial content.

Use different card structures or labels. For product cards, prioritize:

1. Product image.
2. Product name.
3. Price.
4. Delivery or stock information.
5. Primary action.

Avoid putting long marketing copy inside product cards.

8. Content and Copy Review

8.1 Generic luxury vocabulary

The homepage reportedly uses words and phrases such as:

- Curated.
- Elevate.
- Unforgettable.
- Intentional.
- Bespoke.
- Effortless.
- Premium.
- Thoughtful.
- Superpowers.
- Signature.
- Extraordinary.

These words are not inherently wrong. The issue is density and lack of supporting detail.

For example, “curated” is more useful when paired with an explanation:

> Curated Nairobi-ready gifts selected for same-day dispatch.

“Bespoke” is more useful when paired with process information:

> Build a hamper from three or more products. We wrap it, add your message, and confirm the final package by WhatsApp.

8.2 Possible AI-slop characteristics

The term “AI slop” should not be used to claim that the website was generated by AI. It is more accurate to use it as a design-quality label for content that feels generic, repetitive, overproduced, or weakly edited.

Possible AI-slop signals include:

- Interchangeable luxury slogans.
- Abstract emotional promises.
- Repeated “curated” language.
- Many similarly structured feature cards.
- Generic SaaS-style problem-and-solution sections.
- Excessive use of rounded cards and gradient buttons.
- Floating emojis used as decorative fillers.
- Repeated testimonial text.
- Conflicting catalog claims.
- Features described with fashionable but vague terms.
- More emphasis on atmosphere than on operational detail.

8.3 Concrete content improvements

Replace abstract copy with details that answer shopper questions.

Instead of

> Elevate the art of gifting.

Use:

> Same-day gifts delivered across Nairobi.

Instead of

> Your gifting superpowers.

Use:

> Services that make gifting easier.

Instead of

> Thoughtful, elegant and delivered with impeccable care.

Use:

> Hand-packed gifts with a message card, delivery updates, and same-day Nairobi dispatch when ordered by 6 PM.

Instead of

> A tightly curated edit so you are never scrolling through filler.

Use:

> Start with ready-to-send gifts under KSh 2,000, KSh 5,000, or KSh 10,000.

8.4 Corporate-gifting copy

The corporate section communicates a useful offering but should provide more operational information:

- Minimum order quantity.
- Branding methods.
- Branding turnaround time.
- Accepted logo formats.
- Bulk delivery options.
- Whether one order can have multiple recipients.
- Whether individual messages can be added.
- Whether a dedicated invoice is available.
- Whether delivery reports are provided.

The current emotional corporate copy should be supported by practical details.

9. Possible AI-Slop Assessment

9.1 Summary

Overall risk: Medium to high.

This rating does not mean the website was made by AI. It means the interface contains patterns commonly associated with low-edit, template-heavy, or automated design production.

9.2 Main indicators

Generic interchangeable headlines

The hero headlines could apply to many premium gift, lifestyle, fashion, flower, or hospitality brands.

Formulaic feature cards

Many cards follow the same pattern:

- Emotional title.
- Icon or emoji.
- One sentence.
- Pill-shaped CTA.
- Decorative background.

When too many sections use this structure, the interface begins to feel assembled rather than designed around a clear hierarchy.

SaaS-style framing

“The Gifting Dilemma” and “Your gifting superpowers” use the language of software landing pages. That framing may be less natural for a customer trying to purchase a gift quickly.

Decorative emoji use

Floating emojis such as gift bags and presents may clash with the premium serif and luxury color system. They make the site feel more playful and app-like, which may conflict with the intended boutique positioning.

Repeated reviews

A sequence of four reviews reportedly appears multiple times in a carousel or marquee. Repeating the same content can make social proof appear artificially inflated.

Conflicting data

Conflicting counts are one of the strongest signs of insufficient content curation. They do not prove AI generation, but they do make the site feel assembled from disconnected sections.

Too many features

The homepage promotes:

- Gift Finder.
- Gift Assistant.
- Gift Lab.

- Gift Cards.
- Pool a Gift.
- Anonymous Gifting.
- Photo Proof.
- Subscriptions.
- Rewards.
- Corporate Gifting.
- Multiple catalogs.
- Mood selection.
- Delivery coordination.

A feature can be useful and still be inappropriate for the homepage if it competes with the core task.

10. Aesthetic and Visual Design Assessment

10.1 Brand distinctiveness — strong

The deep plum, magenta, gold, and editorial serif combination provides a recognizable visual identity. The design does not look like a generic white-background marketplace.

The Nairobi and Kenya positioning also contributes to distinctiveness.

10.2 Color harmony — acceptable but inconsistent

The dark palette is visually coherent when used consistently. Problems arise when mood states introduce additional colors while permanent magenta and gold elements remain unchanged.

If a mood selector changes the page from magenta to green or blue, the rest of the interface should adapt or remain neutral. Otherwise, the site may appear visually fragmented.

10.3 Typography — strong foundation

The serif display typography communicates elegance. The sans-serif body typography supports product details, labels, and prices.

The main issue is not the font pairing but the number of headings and labels. When nearly every block is treated as a heading, typographic hierarchy loses meaning.

10.4 Text hierarchy — needs improvement

The homepage reportedly contains a very high number of headings, including product titles marked as headings.

This creates problems for:

- Visual scanning.
- Screen-reader navigation.
- Search-engine semantics.
- Understanding the page structure.
- Distinguishing actual sections from individual product names.

Use:

- One H1 for the main page.
- H2 for major sections.
- H3 only for meaningful subsections.
- Non-heading text elements for ordinary product-card titles where appropriate.

10.5 Buttons and CTAs

The site uses several button treatments:

- Magenta pill.
- Gold gradient pill.
- White pill.
- Dark outlined pill.
- Green WhatsApp button.
- Icon-only circular controls.

The individual styles may look attractive, but together they compete for attention.

Recommended hierarchy

- One primary CTA color.
- One secondary CTA treatment.
- One support/contact treatment.
- Neutral controls for filtering and navigation.

Use color to communicate priority, not merely decoration.

10.6 Spacing

The website reportedly uses generous section spacing, which helps the dark interface breathe. However, the fixed header appears to cover part of the hero because the main page does not reserve enough top spacing.

This is a functional layout problem rather than a minor visual imperfection.

10.7 Long-page fatigue

The homepage contains many major sections and multiple horizontal product rows. Even if each section is individually attractive, the cumulative effect is tiring.

A first-time customer may have to pass through:

- Hero.
- Mood selector.
- Product feed.
- Corporate section.
- Dilemma cards.
- Categories.
- Services.
- Hampers.
- Fragrances.
- AI quiz.
- Catalog banner.
- Statistics.
- Testimonials.
- Review invitation.
- Concierge.
- FAQ.
- Newsletter.
- Footer.

The page would be easier to use if it introduced the core shopping action first, then placed secondary features after the customer had a clear route into the catalog.

11. Eye-Friendliness and Visual Comfort

11.1 Dark mode

Dark mode is visually distinctive and can be comfortable for some users. However, dark interfaces are not automatically accessible or eye-friendly.

Potential issues include:

- Muted text that becomes too faint.
- Bright accent colors that create visual glare.
- Too many glowing elements.

- Continuous floating animations.
- Large areas of near-black content with small bright text.
- Excessive use of uppercase labels.

A luxury dark theme should use enough contrast and spacing to remain readable without forcing users to concentrate intensely.

11.2 Light mode

The reported light-mode results are a major concern. Numerous hardcoded white and gold text styles may remain unchanged when the background becomes light.

Reported examples include:

- Gold text with approximately 2.04:1 contrast.
- White or near-white body text with approximately 1.03:1 contrast.
- More than 200 text elements failing the stated contrast checks.

If confirmed, light mode should not be considered production-ready.

Recommended fix

Create explicit theme tokens:

```
:root {
  --text-primary: #ffffff;
  --text-secondary: #e4d9e7;
  --text-muted: #b7a7bd;
  --surface: #140217;
  --accent: #e04b88;
  --accent-gold: #e4bd55;
}

[data-theme="light"] {
  --text-primary: #20151c;
  --text-secondary: #4b3d45;
  --text-muted: #6b5b65;
  --surface: #fffaf5;
  --accent: #8f164e;
  --accent-gold: #755516;
}
```

Then ensure all components use semantic variables rather than hardcoded `text-white`, `text-gold`, or opacity-based colors.

11.3 Motion and auto-rotation

Reported motion includes:

- Mood changes every four seconds.
- Animated background particles.
- Count-up statistics.
- Carousel movement.
- Dynamic hero content.

WCAG includes requirements for moving, blinking, scrolling, or auto-updating content that starts automatically and continues alongside other content; applicable content should provide a way to pause, stop, or hide it. [1] [3]

Concerns

- Users may be reading content when it changes.
- Motion can distract from shopping.
- The site may feel hyperactive rather than luxurious.
- Reduced-motion CSS may not stop JavaScript-driven content changes.
- Screen-reader users may encounter changing content unexpectedly.

Recommended direction

- Stop automatic mood cycling.
- Allow the visitor to select the mood manually.
- Provide pause controls for rotating content.
- Respect `prefers-reduced-motion` in both CSS and JavaScript.
- Avoid changing headings automatically.
- Use animation for feedback, not for constant decoration.

12. Responsive Design Findings

12.1 Desktop

Reported desktop problems include:

- Overlapping announcement messages.
- Fixed header covering hero content.
- Text clipping inside product cards.
- Dense navigation.
- Strong visual competition among header controls.

12.2 Laptop

Reported laptop problems include:

- Navigation becoming crowded.
- Hero eyebrow text being approached or overlapped by navigation.
- Floating buttons colliding with mood-selector content.

12.3 Tablet

Reported tablet problems include:

- Navigation labels wrapping onto multiple lines.
- Irregular navigation heights.
- Floating action buttons overlapping the mood selector.
- Hybrid behavior that may not feel intentionally designed.

12.4 Standard mobile

Reported mobile problems include:

- Fixed bottom navigation covering content.
- Floating buttons positioned directly above the bottom bar.
- Content ending behind fixed elements.
- Potentially insufficient top-level search and identity.
- Multiple persistent controls competing for screen space.

12.5 Compact mobile

The 375 × 667 viewport represents an important real-world constraint. On smaller phones, the lower interface may occupy approximately one-fifth of the screen.

The WhatsApp and Gift Assistant buttons reportedly overlap mood chips such as:

- “I Want to Wow Them.”
- “It’s Business, But Personal.”

This is a direct usability problem because controls are covering other controls.

12.6 Narrow screens and zoom

Reported findings include:

- Theme toggle pushed off-screen at 320px.
- Horizontal carousels creating extremely wide scroll areas.
- Desktop-to-mobile transitions occurring at unusual widths.
- A 200% zoom state becoming difficult to use.

Responsive design should be tested not only at common device widths but also at narrow widths and increased text sizes. A responsive interface must reflow without hiding essential functionality.

13. Accessibility Assessment

13.1 Bypass blocks

The site reportedly lacks a skip link.

Without a “Skip to main content” link, keyboard and screen-reader users may need to pass through a long header and navigation structure before reaching the main content.

Recommended implementation:

```
<a class="skip-link" href="#main-content">
  Skip to main content
</a>

<main id="main-content">
  ...
</main>
```

The link should become visible when focused.

13.2 Heading structure

The homepage reportedly contains approximately 131 headings.

Problems include:

- Product titles marked up as headings.
- Repeated carousel clones creating duplicate heading content.
- Excessive heading density.
- Heading structure that may not reflect the true information architecture.

Recommended structure:

```
<h1>Same-day gifts delivered across Nairobi</h1>

<section aria-labelledby="featured-heading">
  <h2 id="featured-heading">Featured gifts</h2>

  <article>
    <p class="product-title">Product name</p>
  </article>
</section>
```

Only use headings when they divide meaningful content sections.

13.3 Accessible names and states

Reported problems include:

- Mood buttons without `aria-pressed` or an equivalent selected state.
- Icon-only controls without clear accessible names.
- Search inputs relying on placeholders rather than visible labels.
- Newsletter fields without persistent labels.

Example for mood buttons:

```
<button
  type="button"
  aria-pressed="true"
>
  We're celebrating
</button>
```

Example for a search field:

```
<label for="gift-search">Search gifts</label>
<input
  id="gift-search"
  name="q"
  type="search"
  placeholder="Search gifts, hampers, occasions"
/>
```

13.4 Focus visibility

Reported findings include:

- Search input with no visible focus ring.
- Logo control with no visible focus ring.
- Header focus indication with insufficient contrast.

WCAG 2.2 includes requirements concerning visible focus, focus not being obscured, and focus-indicator size and contrast. [1] [2] [4]

Recommended focus style:

```
:focus-visible {
  outline: 3px solid #ffd166;
  outline-offset: 3px;
}
```

The focus indicator should be clearly visible in both dark and light themes.

13.5 Target sizes

The review reports interactive elements below 24 × 24 CSS pixels and others below 44 × 44 pixels.

WCAG 2.2 defines a 24 × 24 CSS-pixel minimum target-size criterion for applicable pointer targets, while larger targets are generally more comfortable on touch devices. [3]

The following should be enlarged:

- Small announcement links.
- Secondary navigation buttons.
- Footer links.
- Theme toggle.
- “See all” links.
- Small icon-only controls.
- Mobile bottom-navigation items.

13.6 Contrast

Reported dark-mode issues include muted magenta and mauve text failing minimum contrast.

Reported light-mode issues are more severe because white and gold text may remain on pale backgrounds.

All color combinations should be rechecked with an automated tool and manually validated across:

- Normal text.
- Large text.
- Disabled text.
- Placeholder text.
- Button labels.
- Focus indicators.
- Icons carrying meaning.
- Price labels.
- Product metadata.

13.7 Fixed interface obstruction

Fixed navigation and floating controls should never cover:

- Product titles.
- CTA buttons.

- Form fields.
- Focused controls.
- Error messages.
- Last lines of content.

The page should provide sufficient bottom padding, but spacing alone may not be enough if floating buttons continue to overlap content.

13.8 Reduced motion

A reduced-motion preference should affect:

- JavaScript timers.
- Mood cycling.
- Hero transitions.
- Marquee movement.
- Floating background elements.
- Count-up animations.
- Modal entrance animations.

A CSS-only reduction may not be sufficient if JavaScript still changes text or attributes.

14. Usability and HCI Review

14.1 Nielsen-style heuristic observations

Visibility of system status

Positive examples:

- Cart badge changes when an item is added.
- Mood selection appears to change the active state.
- FAQ chevrons change when opened.
- Gift Assistant opens and closes.

Weaknesses:

- Add-to-bag lacks a clear toast or confirmation.
- Initial statistics may show zero values.
- Auto-changing hero content can make system changes feel unprompted.
- Search and navigation state may not always be obvious.

Match between system and the real world

Positive examples:

- Kenyan Shilling pricing.
- Nairobi delivery language.
- M-PESA references.
- Ruracio Season content.
- Corporate and recipient-oriented gifting language.

Weaknesses:

- “Superpowers” and “gifting dilemma” may feel less natural than practical shopping language.
- The site sometimes speaks like a software platform instead of a local gifting service.

User control and freedom

Weaknesses include:

- Automatic mood changes.
- Fixed floating controls that cannot easily be dismissed.
- Possible modal obstruction.
- Long scroll depth before all key information is reached.

Consistency and standards

Weaknesses include:

- Multiple WhatsApp numbers.
- Multiple product totals.
- Multiple category totals.
- Different CTA styles.
- Repeated sections with inconsistent wording.
- Navigation controls that may not behave consistently.

Error prevention

Positive examples:

- Search suggestions.
- Product quantity controls.
- Delivery scheduling.
- FAQ explanations.

Weaknesses:

- Incorrect support link.
- Possible lack of clear delivery-fee information before checkout.
- Form fields lacking strong labels.
- Potentially unclear status after add-to-bag.

Recognition rather than recall

The website generally exposes many options, but too many visible options can also overwhelm the user. Recognition helps only when the interface groups choices into clear priorities.

Flexibility and efficiency

Advanced tools such as AI Gift Finder, Gift Lab, anonymous delivery, and corporate orders support different user types. However, these tools should not all compete for the same attention on the homepage.

Aesthetic and minimalist design

The site is not minimalist in its current form. Its visual language is attractive, but content density and feature density make the overall experience heavy.

Help users recover from errors

Reported 404 and empty-search behavior appears reasonable, but checkout and payment failure recovery should be tested directly.

Help and documentation

The FAQ is useful, but important operational details should be visible earlier:

- Delivery fees.
- Area coverage.
- Same-day cut-off.
- Product stock status.
- Alcohol-delivery constraints.
- Returns and refunds.
- Corporate lead times.

15. Core User Journeys

15.1 Understand the offering within five seconds

Result: Partial.

A visitor can recognize that the website sells premium gifts, but the rotating emotional language may not immediately clarify the full offering.

A clearer first message should identify:

- Gift categories.
- Delivery location.
- Delivery speed.
- Price or shopping entry point.

15.2 Find a birthday gift

Result: Possible but not optimally direct.

The user may need to choose between:

- Search.
- Mood selection.
- Occasion navigation.
- Gift Finder.
- Category browsing.
- Product rows.

A dedicated “Birthday” path should be prominent and functional.

15.3 Find a gift by budget

Result: Generally available.

Budget paths appear in the mega menu and mobile chips. This is one of the clearer discovery systems.

15.4 Find a gift by occasion

Result: Needs verification and repair.

The “Occasions” navigation control reportedly presents a dropdown affordance but did not open a menu during testing.

15.5 Find a perfume

Result: Clear.

The fragrance section and category route make perfumes relatively easy to find.

15.6 Build a hamper

Result: Available through Gift Lab.

The feature is useful, but the page should make the process clear:

1. Choose a base or container.
2. Select products.
3. Add a message.
4. Confirm wrapping.
5. Choose delivery.
6. Pay.

15.7 Send a gift anonymously

Result: Available.

The feature is clearly promoted, but it should explain:

- What the recipient sees.
- What appears on the delivery note.
- Whether the sender's phone number is hidden.
- Whether the recipient can contact the store.
- What happens if the recipient refuses delivery.

15.8 Add an item to the bag

Result: Works, but feedback is weak.

The cart badge changes, but the user does not receive a strong confirmation message.

Recommended confirmation:

> Added to your bag: Product Name — KSh X.
> [View bag] [Continue shopping]

15.9 Understand delivery cost

Result: Partial.

The same-day cut-off is visible, but delivery fees may not be clear until later in the process.

Users should see at least:

- Nairobi delivery base fee.
- Area-based variations.
- Nationwide delivery estimate.
- Same-day eligibility.
- Alcohol-delivery restrictions if applicable.

15.10 Contact support

Result: Confusing because of inconsistent WhatsApp destinations.

The visible header link should always point to the verified number.

15.11 Distinguish products from promotional features

Result: Difficult.

Product cards and service cards share similar visual treatments. Their differences should be made obvious through labels, layout, and hierarchy.

16. Trust, Authenticity, and Credibility

16.1 WhatsApp number problem

The reported desktop header link points to:

`https://wa.me/254700000000`

This appears to be a placeholder or dummy number, while other sections display:

`+254 142 677 898`

This is a critical trust problem because the header is among the most visible parts of the website.

Required action

- Replace every WhatsApp link with the verified business number.
- Search the entire codebase for `254700000000`.
- Test the links on desktop and mobile.
- Confirm that the WhatsApp number opens correctly.
- Keep the number consistent in the footer, header, concierge section, and floating button.

16.2 Social-proof counter bug

The page reportedly initially displays values such as:

- `0+ Gifts delivered`.
- `0% On-time delivery`.
- `0+ Curated products`.
- `0.8/5 Average rating`.

Even if the values later animate to the intended numbers, slow connections or screen readers may expose the initial values.

This can destroy trust because visitors may interpret the page as saying:

- No gifts have been delivered.
- Delivery performance is 0%.
- The rating is 0.8 out of 5.

Required action

Render the final trustworthy value in the initial HTML. Animation should enhance the presentation, not determine whether the content is accurate.

Example:

```
<span data-counter="10000">10,000+</span>
<span data-counter="99">99%</span>
<span data-counter="500">500+</span>
<span data-counter="4.8">4.8/5</span>
```

If JavaScript fails, the content should remain correct.

16.3 Testimonials

The reported testimonials include:

- Grace W.
- James K.
- Anonymous.
- Mary N.

Potential weaknesses:

- Repetition.
- Generic language.
- No dates.
- No product names.

- No delivery-location context.
- No verified-purchase labels.
- No direct connection to the Google review invitation.

Recommended direction

Use fewer, more credible testimonials. For each review, where permission exists, include:

- First name and initial.
- Product or service used.
- General location, such as Westlands or Kilimani.
- Occasion.
- Month or year.
- Verified-order label.

Never invent testimonials. If the reviews are placeholders, replace them with real customer feedback before public promotion.

16.4 Real-team claim

The website uses language such as:

> A real team behind every ribbon.

That is a strong trust claim. It would be more credible with:

- A real team photograph.
- A packing-bench photograph.
- A shopfront or office photograph.
- A short caption about the Nairobi operation.
- A named customer-support or fulfillment process.

16.5 Payment and registration claims

Payment badges and “registered Kenyan business” messaging support trust, but such claims should be accurate and verifiable.

The site should provide or link to:

- Business registration information where appropriate.
- Privacy policy.
- Terms and conditions.
- Returns and refunds.
- Delivery policy.
- Payment-security explanation.

17. Technical and Browser Findings

17.1 Supabase WebSocket CSP issue

The reported console error indicates that the Content Security Policy permits HTTPS Supabase connections but does not permit the corresponding WebSocket connection.

The blocked endpoint resembles:

```
wss://vuspfwmhqgbddosauvtj.supabase.co/realtime/v1/websocket
```

The CSP should be reviewed so that the required WebSocket origin is explicitly allowed, if real-time functionality is required.

A possible policy direction is:

```
connect-src 'self'
  https://*.supabase.co
  wss://*.supabase.co
  https://api.openai.com
  https://api.x.ai
  https://generativelanguage.googleapis.com
  https://openrouter.ai
  https://pay.pesapal.com
  https://cybqa.pesapal.com
  https://www.google-analytics.com
  https://vitals.vercel-insights.com;
```

The final policy should be tested carefully and limited to actual required origins.

17.2 Unsafe-eval CSP warning

The console reportedly contains an `unsafe-eval` violation.

Do not automatically add `'unsafe-eval'` to production CSP without identifying the dependency that requires it. Instead:

1. Identify the library invoking `eval()` or `Function()`.
2. Check whether it is development tooling or production code.
3. Upgrade or replace the dependency if possible.
4. Confirm whether the warning comes from a browser extension or the website itself.
5. Retest in a clean browser profile.

17.3 Permissions-Policy warnings

The browser reportedly rejects or does not recognize several Permissions-Policy features, including:

- `attribution-reporting`.
- `private-aggregation`.
- `join-ad-interest-group`.
- `run-ad-auction`.

These headers should be reviewed and obsolete or unsupported directives removed.

17.4 Form-field warnings

The browser reports form fields without an `id` or `name` attribute.

Every form field should have:

- A unique `id`.
- A meaningful `name`.
- A visible or programmatically associated label.
- Correct input type.
- Clear validation behavior.

Example:

```
<label for="newsletter-email">Email address</label>
<input
  id="newsletter-email"
  name="email"
  type="email"
  autocomplete="email"
  required
/>
```

17.5 Page titles

Reported route titles contain duplicate suffixes such as:

> Product Name | TouchGift | TouchGift

Each route should have one clear title:

> Tall Horse Sweet Red 750ml | TouchGift

18. Prioritized Improvement Roadmap

Priority 0: Trust and functional correctness

1. Fix the header WhatsApp link

Replace the placeholder number with the verified business number across every interface.

2. Fix initial social-proof values

Ensure the initial HTML displays accurate values rather than zero values.

3. Resolve header and hero overlap

Reserve layout space for the fixed header. Confirm at all desktop widths.

4. Remove or fix overlapping announcement bars

Only one announcement should occupy the announcement region at a time.

5. Reconcile all catalog numbers

Create a single authoritative catalog-count source.

Priority 1: Accessibility and mobile usability

6. Repair light-mode contrast

Use semantic theme tokens and rerun automated contrast tests.

7. Fix mobile bottom obstruction

Add safe spacing and remove overlapping floating controls.

8. Add visible focus states

Test keyboard navigation through:

- Header.
- Search.
- Mega menu.
- Mood selector.
- Product cards.
- Cart.
- Forms.
- Floating controls.

- Modal dialogs.

9. Add a skip link

Allow keyboard users to bypass repeated navigation.

10. Correct heading hierarchy

Reduce the number of headings and remove duplicate carousel headings from the accessibility tree.

11. Increase target sizes

Ensure interactive elements meet at least the applicable 24 × 24 CSS-pixel minimum and use larger touch targets wherever practical.

Priority 2: Simplify the experience

12. Stop automatic mood rotation

Let users select their mood manually.

13. Reduce the homepage

Keep the primary route focused on:

1. What TouchGift sells.
2. Where it delivers.
3. How quickly it delivers.
4. How to browse.
5. How to contact the business.

Move secondary features deeper into the site.

14. Consolidate CTAs

Use one main CTA in the hero and one secondary CTA.

15. Reorganize feature cards

Rename “Your gifting superpowers” to a more direct section such as:

> Services that make gifting easier.

16. Separate service cards from product cards

Make the product catalog visually dominant and easy to recognize.

Priority 3: Content and authenticity

17. Replace generic copy

Use concrete details about:

- Product types.
- Prices.
- Delivery times.
- Wrapping.
- Customization.
- M-PESA.
- Corporate order requirements.

18. Remove duplicate testimonials

Use a smaller set of distinct, genuine reviews.

19. Add local context

Where appropriate, include:

- Nairobi delivery areas.
- Actual gifting occasions.
- Local payment behavior.
- Genuine customer stories.
- Real workshop or team photography.

20. Verify all claims

Check:

- Product totals.
- Category totals.
- On-time percentage.
- Number of gifts delivered.
- Average rating.
- “Authentic fragrance” claims.
- Same-day delivery coverage.

- “On-time or it’s free.”
- “100% secure checkout.”

19. Suggested Homepage Architecture

A simpler homepage could use the following structure.

Section 1: Clear hero

Headline:

> Same-day gifts delivered across Nairobi.

Supporting copy:

> Hampers, flowers, fragrances, drinks, and corporate gifts. Order by 6 PM for same-day Nairobi delivery.

Primary CTA:

> Shop gifts

Secondary CTA:

> Find a gift

Section 2: Quick shopping paths

- Birthday.
- Anniversary.
- Corporate.
- Flowers.
- Hampers.
- Under KSh 2,000.

Section 3: Featured products

Display a small number of products with:

- Image.
- Name.
- Price.
- Delivery status.
- Add-to-bag action.

Section 4: How delivery works

- Choose a gift.
- Add a message.
- Select delivery.
- Receive delivery updates and photo proof.

Section 5: Services

- Build a hamper.
- Send anonymously.
- Corporate gifting.
- Gift cards.
- Photo proof.

Section 6: Trust information

- Same-day Nairobi.
- Next-day nationwide.
- M-PESA, Visa, Mastercard.
- Physical location.
- Real review count.
- Clear support channel.

Section 7: Genuine testimonials

Show three or four real reviews, without repeating them.

Section 8: FAQ

Answer:

- Delivery times.
- Delivery fees.
- Future scheduling.
- Anonymous gifting.
- Corporate branding.
- Returns.
- Payment options.

Section 9: Footer

Keep one newsletter form and one consistent contact path.

20. Suggested Content Rewrite

Hero

Current style

> Elevate the art of gifting.

Recommended version

> Same-day gifts delivered across Nairobi.

> Shop ready-to-send hampers, flowers, fragrances, drinks, and corporate gifts. Order by 6 PM for same-day Nairobi delivery.

Mood selector

Current style

> How do you want them to feel?

Recommended version

> What are you shopping for?

- Birthday.
- Anniversary.
- Thank you.
- Congratulations.
- Corporate.
- Just because.
- I need help choosing.

This does not mean emotional gifting should be removed. It means that the most important discovery control should use language shoppers can immediately act on.

Services

Current style

> Your gifting superpowers.

Recommended version

> Services that make gifting easier.

- Build a hamper.
- Send anonymously.
- Add a personal message.
- Get photo proof before dispatch.
- Send gifts to multiple recipients.
- Pay together through M-PESA.

Corporate section

Recommended version

> Corporate gifts, packed and delivered for your team or clients.

> Order from 10 units, add your logo or message, and send to one location or multiple recipients across Nairobi.

21. Evidence Register

ID	Finding	Classification	Confidence
E-01	Desktop WhatsApp header points to 254700000000	Directly observed fact	High
E-02	Footer and concierge display a different WhatsApp number	Directly observed fact	High
E-03	Social-proof counters initially display zero-like values	Directly observed fact	High
E-04	Product and category counts conflict across the site	Directly observed fact	High
E-05	Testimonials repeat in the carousel or DOM	Directly observed fact	High
E-06	Announcement messages overlap on desktop	Directly observed fact	High
E-07	Fixed header overlaps hero content	Directly observed fact	High
E-08	Floating controls overlap mobile content	Directly observed fact	High

ID	Finding	Classification	Confidence
E-09	Light-mode contrast failures occur	Automated test result reported	High, subject to rerun
E-10	Mood or hero content changes automatically	Directly observed fact	High
E-11	No obvious pause control exists	Directly observed fact	High
E-12	Navigation control appears interactive but does not open	Interaction test result	Medium-high
E-13	Product title clipping occurs	Directly observed fact	High
E-14	Heading count is unusually high	DOM inspection result	High
E-15	Possible AI-slop characteristics	Design interpretation	Medium-high
E-16	Testimonials may appear synthetic	Design interpretation	Medium
E-17	Users will experience decision fatigue	Design interpretation	Medium
E-18	Specific conversion impact	Requires analytics	Unknown
E-19	Accessibility impact for screen-reader users	Requires assistive-technology testing	Partially confirmed
E-20	Checkout drop-off at PesaPal	Requires analytics	Unknown

22. Testing Required Before Final Release

22.1 Accessibility testing

Perform testing with:

- NVDA and Chrome.
- VoiceOver and Safari.
- Keyboard-only navigation.
- 200% browser zoom.
- 320px CSS viewport.
- High-contrast or forced-colors mode.
- Reduced-motion enabled.
- Light and dark themes.

22.2 Usability testing

Recruit actual or representative Kenyan shoppers and test:

- Birthday gift purchase.
- Gift under KSh 2,000.
- Fragrance purchase.
- Anonymous gift.
- Corporate bulk order.
- Hamper creation.
- Delivery scheduling.
- M-PESA payment understanding.
- Returns and support discovery.

22.3 Analytics testing

Measure:

- Hero CTA clicks.
- Search usage.
- Category usage.
- Mood-selector usage.
- AI Gift Finder completion.
- Add-to-bag rate.
- Cart-to-checkout rate.
- Checkout completion.
- WhatsApp clicks.
- Mobile versus desktop conversion.
- Drop-off after PesaPal redirect.
- Use of anonymous gifting.
- Use of corporate tools.

22.4 Content verification

Confirm:

- Product counts.
- Category counts.
- Review authenticity.
- Rating value.

- Delivery statistics.
- Same-day delivery promise.
- Delivery fee information.
- Corporate minimums.
- Contact numbers.
- Business registration claims.
- Payment claims.

23. Final Assessment

TouchGift has a strong foundation. It is not a generic storefront in terms of visual ambition or business concept. The combination of Kenyan delivery, M-PESA relevance, corporate gifting, anonymous delivery, gift customization, and a broad product catalog gives the platform genuine differentiation.

The main problem is that the site is trying to communicate too much at once. Its premium aesthetic is weakened by:

- Repeated copy.
- Excessive feature promotion.
- Conflicting catalog figures.
- Repeated testimonials.
- Decorative emojis.
- Automatic motion.
- Competing CTA styles.
- Mobile interface congestion.
- Light-mode contrast failures.
- Incorrect support-link configuration.
- Initial trust-metric errors.

The website should not be described as definitively AI-generated. The more accurate conclusion is that it shows **medium-to-high AI-slop risk** in the design-quality sense: generic luxury copy, repetitive card structures, abstract SaaS-style framing, decorative embellishment, duplicated social proof, and inconsistent content appear insufficiently edited.

Final scorecard

Dimension	Assessment
Brand distinctiveness	4.0 / 5
Typography and visual identity	4.0 / 5

Dimension	Assessment
Color and visual harmony	3.0 / 5
Visual comfort	2.5 / 5
Simplicity and usability	3.0 / 5
Mobile usability	2.0 / 5
Accessibility readiness	2.0 / 5
Trust and content authenticity	2.5 / 5
AI-slop risk	Medium–High
Production readiness	2.5 / 5

Final conclusion

TouchGift should first become **clear, trustworthy, accessible, and easy to shop**, and only then add more visual effects and advanced features. The most important work is not a complete redesign. It is disciplined reduction and correction:

1. Fix the wrong WhatsApp link.
2. Fix the initial statistics.
3. Fix the header overlap.
4. Fix light-mode contrast.
5. Remove mobile control obstruction.
6. Stop automatic mood changes.
7. Repair broken or misleading navigation.
8. Remove duplicate testimonials and repeated content.
9. Reconcile every product and category count.
10. Replace generic marketing language with specific local shopping information.
11. Preserve the strongest brand elements: the plum-and-gold identity, editorial typography, Kenyan context, and genuinely useful gifting services.
12. Validate the revised experience with real users and accessibility technologies.

After these changes, TouchGift can retain its premium character while becoming much more credible, calm, inclusive, and effective for everyday shoppers and corporate clients.
